

Water Issues

Anglia Water highlight that although the population in the area they serve has increased by 20 per cent in the last 20 years the amount of water supplied remains unchanged since 1990. They cite greater efficiency, fewer leaks and use of metering as major factors. They also do not feel that limits on water supply or the capacity to deal with waste water would impose a limit on increased housing development and population in this region for many years to come! One wonders whether water transference is on the increase and how the farmers will fair?
